BioPreparation/BioSuperfood and Seizures

*I adopted a 1 year, 4 month old, 47 pound, American Staffordshire Terrier, Skye, last December. She began having seizures after she went into 'season' for the first time, at the age of about one year old. She doesn't have epilepsy, but **idiopathic juvenile seizures**. An idiopathic juvenile seizure is different from an epileptic seizure, in that it is genetic and comes from one of the parents. However, the seizures can be **just as violent as epileptic seizures** and **Skye had seizures every day and sometimes had seizures in clusters** (more than one at a time). She has had as many as **12 seizures in a 12 hour period**. Unfortunately for Skye, her seizures could not be controlled with **Phenobarbital** alone and they continued every day after she came out of season. It should be noted that a **toxic dose of Phenobarbital was 45 units** (of what measurement I am not sure), however **Skye was on 62 units, and this still did not control the seizures**.*

*Her breeder took her to the state university veterinarian school, as the Phenobarbital was not controlling her seizures; they **added Potassium Bromide** to her medication regime. However, the **Potassium Bromide made her very dopey**. She stumbled when she walked and her gait was very sloppy. She acted like a human drunk.*

*Skye was eventually taken to the University of Minnesota's Veterinary School for tests. The breeder looked into a device, used at the Indiana University Veterinary School, used in people to stop seizures. But it has to be implanted and the cost was exorbitant and there was no guarantee that it would work. Skye's veterinarian decided to try a long shot, **Sodium Bromide**, which is not used much these days. According to the vet, it was **like a miracle, because the seizures finally began to be controlled**.*

*When I brought Skye home, she had been **losing hair and had a red, angry looking rash on her stomach**. It had a damp aspect, like a hot spot, though she didn't have a hot spot. This was **all due to the medication** she was on. After **putting her on your [BioPreparation](#)** late last December, the **rash began to disappear in two days**. The rash was **completely gone in about two weeks**. Not only that, her **hair began to grow back and filling in**.*

*The dogs in this line tend to have curly hair, of which Skye had none when she came to live with me. So, imagine my surprise when she began to develop her own curls on the back of her neck. Not only does she now have **her own curly coat, it has come in thick and lustrous and all the hair she lost due to the medication has come back**.*

*Skye's last seizure was November 3rd of 2007. She had never passed four months without a seizure and I am proud to state that she has now been **seizure free for 14 months** (as of January, 2009).*

Now, you could try to tell me that it is due to the medication she has been on, but you would be wrong and this is why. The medication makes Skye ravenous for anything she can get her mouth on, and as far as she is concerned, nothing is off limits. She has eaten uncooked rice, uncooked pinto beans, and even wild bird seed. But the most distressing item she ever ate was a **bag of dark chocolate M&Ms**. The bag of chocolate was in a place that I never thought she could get to, but she managed. I already knew that [chocolate is toxic to dogs](#), but for a dog with a history of seizures, chocolate is a trigger and can send the animal into a seizure. She has also eaten a bag of chocolate covered raisins ([raisins are also toxic](#)), and again they were where she had to climb to get to them.

I contacted both the breeder and the veterinarian the next day to see if there was anything I should do. They each asked me independently of each other, how many seizures she had had. **I am very happy to report that she had NONE**. Yes, you read correctly; **Skye had no seizures whatsoever**. She did have a case of raging diarrhea for two days, but no seizures. **I attribute this directly to the BioPreparation she is on**. It has been a blessing.

Not only that, when Skye came to live with me, she was on 400mg of Phenobarbital per day and 7.50ml of Sodium Bromide per day. She is now **down** to 200mg of Phenobarbital per day and the Sodium Bromide is still at 7.50ml per day. Our goal is to get her completely off the Phenobarbital and though the vet is telling me that she will probably never be off medication completely, I am hopeful that someday we might be able to get her off the Sodium Bromide too.

In my personal opinion, the [BioPreparation](#) is directly linked to the fact that she has been seizure free, even during an episode that should have made her have a seizure or at least become very, very ill from the chocolate. She has been on BioPreparation since the 29th of December of 2007 and has been **absolutely seizure free**. While I was prepared to deal with seizures if I needed to, I am very grateful to you for this product, as I have **been able to live without the fear of a seizure harming my little girl**. **Thank you so much for your wonderful product and for the joyful gift of a better life you have given my dog, Skye**.

—Ruthie Bently, Owner & Consultant, Bently's Beasties

Mo is a 7 year old male beagle. He chases prairie dogs and gophers and has boundless energy. In August, Mo had a **grand mal seizure and almost died**. His owner, Gib, gave him CPR, including mouth to mouth and resuscitated him. They rushed him to the animal hospital in Basalt where he was **put into a drug induced coma and given Phenobarbital in large doses**. After two days they released him and told Gib that **Mo would have to take the Phenobarbital for the rest of his life to avoid any more seizures**. Poor Mo, he was so sad. He had **no zest; his eyes were dark and lifeless**. Gib knew how we had [saved Cali](#) and so asked us if we would take Mo and get him off of the drugs. I said, yes, but I was very afraid. I had done research on this and knew that Mo could have **another seizure that could kill him** if it did not work. I contacted Russell ([OptimumChoices.com](#)) and told him the story. He sent me documentation regarding seizures, so we ordered [BioPreparation](#) for Mo. The BioPreparation micro algae had [saved our female dog, Cali's life](#); I knew that it could work for Mo too. It was suggested that Mo use BioPreparation-F3+ for dogs, at 4 or 5 capsules per day in the beginning and then after two weeks we might be able to decrease the dosage of the Phenobarbital (with vet supervision) a little at a time until he was off of it. After about a month of weaning, I had gotten him down to 1/8 pill Phenobarbital per day, not much but enough that it was still in his system. He was taking 4 capsules BP-F3+ per day. Then the day came when I got brave and did not give him any Phenobarbital at all. I was scared and had the Phenobarbital ready to

give him if I saw any signs of a seizure coming on. I waited for any changes in his day. I have to tell you, that when he would have the **Phenobarbital** his eyes would get really glassy and he would sit there like he was a drug addict. He had no energy at all while on the drug, his personality was gone, and he was not the same dog at all.

(12/13/2008) I am happy to report that **Mo has not had any Phenobarbital since September 20th; he is down to two BP-F3+ in the morning and one in the evening. I will be reducing the dosage to one in the morning and one in the evening in a week or two. He is full of life, runs up and down the mountain with his mom, Cali, eats like a horse, has sparkle in his eyes, very pink lips and is back**

to his old self again. I know that the [BioPreparation-F3+](#) micro algae saved his life and has given him a very long lease on life. Thank you again for this miraculous product, it saved the life of our Mo, who will continue to be drug-free for a long time to come.

—D.B.

Great — once again, thanks Russell. Since being on the BP f3+ she has all but ceased the seizures. And if they do happen....they are literally only for a few seconds. Have I said enough times to you.....thank you so much for selling BioPreparation and being sooooo helpful!!! I don't know what I...or especially Polly would have done without being introduced to this wonderful miracle! **THANK YOU, THANK YOU, THANK YOU!!!**
K.S.

People Testimonial

My daughter is prone to aura seizures, never big ones (Grand Mal). We could previously tell she had a seizure from ECGs (shows past seizures) scans, whereas MRIs never would show any previous signs. She has been taking your [BioSuperfood](#) to nutritionally help her maintain normal brain function. She recently went to a doctor in Bangkok (one of best hospital in world) where they again, tested her. The doctor said she is **free of seizures and there is no sign of past seizure activity now.** We also give credit to the power of prayer and believed the Lord had a hand in this. Thank you for a wonderful product and helping my daughter become **seizure free.**

—J. S., Denver CO

These results are individual testimonies. We cannot guarantee your results will be the same. Since each individual body responds differently to the super nutrition in BioPreparation/BioSuperfood your results will be different. These statements have not been evaluated by the FDA. This information is not intended to diagnose, treat, prevent or cure any disease.

[BioPreparation/BioSuperfood](#) have no advertised ingredients specifically addressing seizures. And yet look at the results customers are reporting. Most supplements only treat symptoms and do not holistically balance the whole body or energize the brain. How did BioPreparation/BioSuperfood accomplish this feat?

It didn't. BioPreparation/BioSuperfood simply supplied the body with the super nutrients of Vitamins A, B-complex, C, D, E and K, essential fatty acids of Omega-6, Omega-9, GLAs (Gamma-Linolenic Acids), ALAs (Alpha-Linolenic Acids), DGLA (Dihomogamma-Linolenic Acid), DHA (Docosahexaenoic acid) and more fatty acids, over 4,000 enzymes, 20 amino acids, phytonutrients, super antioxidants, chlorophyll, all known trace minerals and elements and thousands of other nutrients so the body could energize and normalize the entire endocrine (glandular) system, including the pituitary (master gland), pineal and hypothalamus glands in the brain and naturally and holistically balance the whole body. When the whole body is hormonally balanced and all the glands (e.g., adrenals and thyroid) and organs (e.g., heart, stomach, intestines, kidneys, liver) are functioning at 100%, then **proper brain signals, motor functions and muscle coordination can return to normal.** BioPreparation/ BioSuperfood are such revolutionary products (concepts) they are 100 years ahead of its time. **Now that's true holistic wellness!**
