

KKNW (1150 AM) Radio Show Talk With Your Animals

May 27 12:00–1:00 PM (PDT)

Host: Joy Turner

with Guest Russell Louie, Optimum Choices, LLC

Introduction

Hi, today we're talking with Russell Louie, who owns Optimum Choices, a holistic wellness business. He believes that if one cannot find the time or money for health now, sooner or later one is obliged to find time and money for medical treatment later. So, his mission is to educate people on healthy choices for themselves and their pets to prevent this. He has studied holistic health and spirituality for over 30 years and lived a holistic lifestyle for over 57 years. His education includes a degree in geophysical engineering and he is a Certified Reiki Master. His desire is to have pets live to be 15-20 years old and still being healthy, like pets used to 50 years ago.

Today, he will be talking about **Aromatherapy and Animals**.

Russell, how can I use essential oils on my dogs?

Joy, if you have ever rescued or adopted a dog, essential oils can have a very profound effect on them. They can help the dog bond with the new owner after such a traumatic experience. I like to use lavender and chamomile oils for their calming effects. Try putting some diluted lavender oil on the back of your hand or a cotton ball in the room. Then affectionately pet or brush your newly adopted dog to bond with it as the calming scent of the essential oil permeates the room and their emotional body. Now the next time a stressful situation arises like a vet visit, car trip or thunderstorm, get out the same diluted lavender oil and reinforce the bonding and calming experience from earlier. If this can be possibly done before the actual stressful situation starts, then the dog will have a head start on handling the stress.

Any other calming oils?

Although I personally do not have show dogs, I have heard that lavender used with a blend of valerian, vetiver, petitgrain, sweet marjoram or sweet orange can be good for calming and relieving the stress for show dogs. I would not suggest putting any of these oils on the show dog directly but would use the cotton ball method. That is, put one or more drops of these essential oils on a cotton ball and put the cotton in their crate as the dog waits to go into the competition ring. Just the scent from these essential oils can calm the emotions down and make an anxious dog mellower.

How about some oils for ligaments and joint injuries?

Lemongrass is known to help regenerate connective tissues, dilates blood vessels and therefore improves circulation and promotes lymph flow. So, just like in humans, lemongrass is good for torn cruciate ligaments and joint injuries in dogs. For arthritis a diluted blend of peppermint

(good for cooling inflammation), cypress (increases circulation), juniper berry and lavender are good to help the body deal with any arthritic inflammation.

That's very useful for my older dogs. Now, how about essential oils good for repelling insects?

Tea tree oil, also known as melaleuca, is excellent for not only for repelling insects and insect bites but also healing sores on the skin.

For an actual insect repellent, one can use a mixture of 10 drops each of citronella, eucalyptus globulus and peppermint in an 8 ounce spray bottle with water. Remember to shake the bottle vigorously before each application, since essential oils and water do not readily mix.

Another recipe from Sandra Topper, a trained aromatherapist in Canada, is 30 drops lavender, 20 drops geranium, 30 drops Tea Tree oil, and 16 drops of citronella oil with 4 ounces of water and one-half ounce of vodka. Mix this recipe in a spray bottle and shake before using as an insect and mosquito repellent.

How about those pesky fleas and ticks?

Fortunately, we do not have much of a flea problem in Colorado. But I can give you a recipe from Kristen Leigh Bell's book, *Holistic Aromatherapy for Animals*, for fleas.

Please do.

Kristen uses ½ ounce (or 15 ml) of a carrier oil such as hazelnut or sweet almond oil as a base. To this carrier oil she adds:

- 4 drops Clary Sage
- 1 drop Citronella
- 7 drops Peppermint
- 3 drops lemon

This should be stored in a dark glass bottle, because essential oils are sensitive to light. One can apply 2-4 drops, depending on the size of your dog, to the neck, chest, legs and base of the tail of the dog. One can also put a few drops on a bandana or cotton collar. I like this latter method because then the essential oil soaked collar can be taken off in the house or whenever the scent is not needed.

Now Kristen uses an entirely different blend for ticks.

Oh, give our listeners that recipe too.

Sure, Joy. Again Kristen starts with a base of ½ ounce (or 15 ml) of a carrier oil such as hazelnut or sweet almond oil. To this base she adds:

- 2 drops Geranium
- 2 drops Rosewood
- 3 drops Lavender
- 2 drops Myrrh
- 2 drops Opoponax

- 1 drop Bay Leaf

One can apply 2-4 drops, depending on the size of your dog, to the neck, chest, legs and base of the tail of the dog. One can also put a few drops on a bandana or cotton collar.

Can I use the same essential oils on my cat?

This is certainly a subject for debate among aromatherapists. Cat's livers do not have the necessary enzymes to break down and excrete certain chemical compounds in essential oils. The chemical compounds, therefore, can accumulate in a cat's body and are sometimes toxic to the point of death. I don't think there is enough scientific evidence to conclusively prove essential oils are totally safe for cats. On the other hand, there are many holistic vets that have used highly diluted essential oils on cats in their practice for years with excellent results and no apparent toxic effects. The key words here are "*highly diluted*". Many aromatherapists state that they have been using essential oils on their cats for years without any harmful effects. I think a more accurate statement would be they have used essential oils on their cats with many visible short-term benefits but the long-term side effects are still unknown. So, I would rather err on the side of caution rather than take a chance of causing long-term liver damage to my cat. Each person needs to make their own decision because any long-term essential oil research is far off, unless one can find a donor to fund it now.

It sounds like one really needs to be cautious when using essential oils around cats?

Yes indeed. Let me give your listeners some rules to avoid doing any harm. Remember, there is no guarantee how a cat will react since each one is an individual. Cats are very sensitive to "hot" spice oils containing phenols, such as oregano, thyme, cinnamon (cassia), clove, and savory. A second compound to avoid would be ketones that are found in sage oil. A third group to avoid is the monoterpene hydrocarbons of pinene and limonene. These compounds are found in the citrus and pine oils, such as lemon, orange, tangerine, mandarin, grapefruit, lime, bergamot, pine, spruce, and any fir oil. That is why many anti-scratching remedies have citrus oils in them because cats instinctually don't like the scent.

Many household cleaners and even pet products have these latter substances in them to make them smell nice to the owners so be cautious. After using a product with citrus or pine scents it would be best to let the area dry and air out before a cat walks on the surface. Symptoms of a toxic buildup include being despondent, clumsy, uncoordinated, partially paralyzed, vomiting, drooling or in a daze. The diagnosis for toxic poisoning is a blood test that shows elevated liver enzymes. It is best to seek a veterinarian's care if toxic poisoning is suspected.

What would you consider to be some safe applications of essential oils on cats?

I like to keep things simple for cats and use just the gentler essential oils like lavender or chamomile for their calming effects and rose or geranium for their healing effects on the skin. For arthritis and joint problems, I prefer to use homeopaths instead of the stronger essential oils.

Do you use essential oils on your cats?

I prefer to use hydrosols on my cats rather than essential oils. Hydrosols are the by-products of essential oil distillation. Hydrosols are the distilled water that is left after the essential oils are filtered out from the distillation process. The safer compounds have an affinity for water and are safe for cats. The caustic compounds, such as the phenols and ketones, do not appear in hydrosols but stay in the essential oils themselves. There are no known case histories of hydrosols causing toxicity in cats.

Hydrosols of chamomile and a combination of rose, lavender, geranium and neroli are known to have a calming effect on cats. Wounds can be cleaned with either highly diluted lavender, rose, geranium, and chamomile essential oil or their hydrosols. Itching can be alleviated using witch hazel, rose, lavender or German chamomile hydrosols.

How would I apply essential oils on my animals?

The easiest and safest application is to apply the essential oils around the animal's environment not on them. Remember, animals have a sense of smell 50-100 times stronger than humans. I like putting essential oils on cotton balls and leaving them around the room where animals frequent. One can spray a dilution of essential oils on the animal's bedding for calm, peaceful sleep. If one is trained in animal aromatherapy, one can apply the oils directly to their paws and body. Never put essential oils on an animal's nose or snout. This takes away their freedom of choice and is intrusive in my opinion. If an animal doesn't like the scent, they can't wash it off themselves.

Can I use essential oils straight out of the bottle?

Most companion animals have considerably less body mass than a human adult, so I always use diluted essential oils. The rule-of-thumb I use for small animals is to start with a 3-4% dilution: that is 1 drop essential oil to 24 drops of carrier oil or 24 drops essential oil to one ounce carrier oil. The carrier oil can be any non-scented nut or vegetable oil used for massage such as sweet almond, sesame, jojoba or hazelnut oil. Of course, olive oil works too. For giant breed dogs, one can use a slightly stronger dilution, say 5-7%. Horses can tolerate a greater strength and sometimes even undiluted essential oils.

If one chooses to use essential oils around cats, what precautions should one take?

We have a chart entitled Essential Oils to Avoid on Cats on our website www.OptimumChoices.com. Here are some rules that I would personally follow when using any of these oils:

1. If I use any of the oils in the charts on myself or around the house, I keep the cats away for at least one hour. I never diffuse in the air any of the oils in the charts or blends containing these oils around cats. This is very important. When using a blend always look on the label for the individual essential oils it contains.
2. I never keep cats in an enclosed area when diffusing oils. I always keep a window open or put the cat in a different part of the house.

3. If I want to use essential oils on cats, I always use a highly diluted formula with essential oils. A 1% dilution would be one drop of essential oil to 99 drops of carrier oil. When in doubt I use hydrosols instead of essential oils on cats. Hydrosols are water-based, gentler and much easier to tolerate.

4. When using cleaning products with the above essential oils, especially citrus or pine, I keep the cats away and off the floor until it dries. I make sure I rinse and dry the surface as thoroughly as possible.

Why does aromatherapy work?

Essential oils are the aromatic liquids found within a plant that contains the plant's DNA codes for healing, reproduction and protection. When a plant gets an infection from bacteria or fungus, it can't go to the doctor or drugstore but must heal itself. If a leaf or stem should break off, it must cauterize the wound and regenerate new cells to heal. A plant must manufacture scents to attract bees for reproduction and repel predators. For plants, essential oils serve the same role as our human blood. Essential oils are nature's medicine kit for plants.

So, how is Nature's medicine kit applicable to our domesticated animals?

Wild animals will instinctually seek out certain plants and eat them for the plant's healing properties. For instance, when bears exit their hibernation cycle in the spring they eat certain berries and plants to purge their bodies. When wild dogs, wolves, cats and horses are sick they seek out certain plants to eat in order to get well. I am sure you have observed cats eating grass then throwing up to clean out their digestive tract. As we domesticated animals, they lost most of this instinct and their access to wild plants. By giving essential oils to our pets when they are ill, we provide them access to nature's medicine chest.

If they are Nature's medicine chest, why are there so many precautions I should take with using essential oils on *my* pets?

Well, Joy, just like all medicines one needs to respect their therapeutic potential and not give an inappropriate dosage for their smaller bodies. Just because something is all-natural, does not make it automatically safe for their bodies. Cats are extremely sensitive to essential oils and one must be careful not to use citrus oil on or around them.

So, how would I safely introduce essential oils to my animals?

It is important to introduce animals to essential oils with a positive experience. It is always best to let the animal smell the oil first before using, then watch for signs of acceptance such as wanting to lick the oil, rubbing against you or appearing wide-eyed and bushy tailed. Signs the animal dislikes the oil are turning their head away, sneezing or snorting, panting, drooling, pacing and whining. If an animal is already fearful from people, loud noises such as thunderstorms or in pain or shock, that is not a good time to introduce a new essential oil because the connection of the new scent with the fearful experience will be imprinted on the

animal. Always introduce the oil first when the animal is calm then later when the fearful event occurs you can bring the oil out again and remind your animal of its first calm experience with that scent.

Any other special steps you would take when using essential oils on animals?

In addition to the oils on our chart at our website, I would also avoid stimulating oils of peppermint, rosemary, melaleuca (Tea Tree), spearmint, ravensara and eucalyptus unless in highly diluted form. It is also recommended to avoid rosemary on dogs that are prone to seizures or with epilepsy. It is not recommended to use essential oils on medium to large breed puppies younger than eight weeks. For small or toy breed puppies wait at least until they are older than ten weeks. When in doubt use the gentler hydrosols (by-products of essential oil distillation) on puppies instead of essential oils.

Here are some more general rules for all animals:

1. It is best to avoid the “hot” spice oils such as oregano, thyme, cinnamon (cassia), clove, and savory. I know oil of Oregano is a very beneficial oil for humans to support bacterial infections, fungus, parasites and candida conditions but I would use extreme caution when using oregano essential oil on or around animals.
2. Only use oils of birch and wintergreen in highly diluted form and sparingly due to the fact they have methyl salicylate a compound similar to Aspirin.
3. Only use therapeutic-grade melaleuca or Tea Tree oil that has been certified to meet the Australian standards. Many cheaper melaleuca oils are not tested for their content of cineole and terpinen and can have a caustic effect on the skin.

How do you determine what essential oil to use on animals?

Rather than assume a certain protocol or suggested oil is good for an animal I always test the essential oil first before using it. I introduce the essential oil to the animal by letting them sniff it and watch for signs of acceptance as mentioned before. I also use kinesiology with a human surrogate tester for the animal. I also use a dowsing pendulum or one of the many electronic radionic devices for testing oils safe for animals.

Do you supply the hydrosols for cats that you talked about?

Hydrosols are really hard to come by. You see, hydrosols are also used in personal care products like people shampoo and lotions. We have a few bottles of chamomile hydrosol in stock but I can recommend a line of hydrosols for cats from AromaCat.com. They make three hydrosol products specifically for cats called Catnap (calming), Purrfect Ears (waxy ears and ear mites), Meow Ouch (antibacterial and anti-inflammatory as well as calming formula) and Scat! No Fleas Please. For dogs there is Arf-ritis Pain Relief which has rosemary and ginger increase the circulation to the area, while juniper acts as a detoxifier, lavender and birch for calming and to help relieve pain. You can order directly from the supplier at www.AromaCat.com or www.AromaDog.com and tell them Optimum Choices sent you.

Where can my listeners get more information about essential oils?

They can go to our website www.OptimumChoices.com, on the home page click on the [Services](#) button across the top menu bar. Then on the Services page, click the [Aromatherapy](#) button in the left column for a description of aromatherapy.

More detailed information can also be found starting at our home page and clicking the [Products](#) button across the top menu bar. Then on the Products page, click the [Essential Oils](#) button in the left column. Here we have buttons for subsequent web pages on [Science](#), [History](#), [Application](#) and [Animal](#) usage.

Sounds like essential oils are very powerful?

Essential oils are a holistic tool that honors the whole body and can move mental, emotional and even stuck physical energy. It is not a substitute for proper veterinary care.

Yes, I think that is important to let our listeners know you always suggest they take their pet to a vet for proper veterinary diagnosis. But then they can also research holistic alternatives.

I would also like to point out that essential oils can be used allopathically and holistically. Just because they are all-natural, does not mean all essential oils usage is holistic. If one just uses a specific essential oil to get rid of the symptoms, then that is not holistic. One must also holistically look at the origin of the symptoms and nutritionally address any deficiencies, balance whatever gland or organ is malfunctioning and take preventative holistic steps so the symptoms do not reoccur in the future.

You seem to have wealth of pet knowledge. How can we access more of your 57 years of holistic wisdom?

One way is to go to our website, www.OptimumChoices.com and sign up for our free monthly [e-newsletters](#). We have written articles on such topics as, Is glucosamine the answer for arthritis? Healthy water for you and your pets and Whole Food Nutrition vs. Supplements. All past articles are archived online and one can search for a specific topic. If your listeners will check the box at the bottom of the subscription form, we'll send subscribers a free report entitled **What Pet Food Companies Don't Want You to Know**. This report contains 11-points some of which we covered today.

What other holistic resources do you have that would be of interest my listeners?

We have written a series of Holistic Choices [e-Books](#). Readers can take advantage of the latest holistic research we find and absorb the information in a small chunk rather than a 100+ page book. The first three titles that have been published are:

- *Save Your Dog or Cat*
- *Secrets of Longevity (for people)*
- *How to become a canine massage provider*

Tell me more about what is in your dogs and cats e-Book.

We start off by telling the reader what Nature designed wild dogs and cats to eat. Then we compare all the various food options from dry kibble to raw food to the optimum diet in Nature. We educate the readers on how to find good premium pet food by reading the labels. Next we discuss all the advantages and disadvantages of a raw food diet and how to transition to a raw diet. We also have a section on what human foods are toxic to pets. Many people don't know that grapes, onions and Xylitol, a sweetener, can be toxic.

Sounds like I need to get a copy of your *Save Your Dog or Cat* e-Book. How can I and my listeners get a copy?

Go to our website www.OptimumChoices.com and click on the [Products] button on our home page, then the [Books] button on the subsequent page. As a special offer, I will give your listeners one e-Book of their choice *free* with their first purchase. Just have them say, “**Joy sent me**” and ask for the *free* e-Book title of their choice with any product purchase.

For more information on Optimum Choices and holistic options for your pet, go to Russell's website at www.OptimumChoices.com. You can call toll-free 866-305-2306 or email them at info@OptimumChoices.com.
